

# SUSTAINABLE ARTIFICIAL INTELLIGENCE

RESEARCH UNIT

RAÚL PARADA ET AL.

Centre Tecnològic de  
Telecomunicacions de Catalunya

# SUSTAINABLE AI @CTTC

- **Our Research**

- **energy-aware, high-performance** and **interpretable machine learning**
  - to support data processing from heterogeneous sources (e.g., sensors, machines, smartphones, mobile networks, satellites, radars) for Cyber Physical Systems (CPS) modeling, control and optimization

- **Our Team**

- 8 PhD (5 senior) + 4 PhD students

- **Participation in EU programs**

- VERGE, 5GMED, 5GCroCo, INSPIRE5G+, PANDORA, DARLENE, FIREMAN
- Coordination: Greenedge, SCAVENGE, SONATA
- SPANISH-MINECO Unico 5G: 6G-OASIS, FREE-6G, SUCCESS-6G

# EXPERIMENTAL FACILITIES

- **SUPERCOM** (Sustainable and High-Performance Computing)

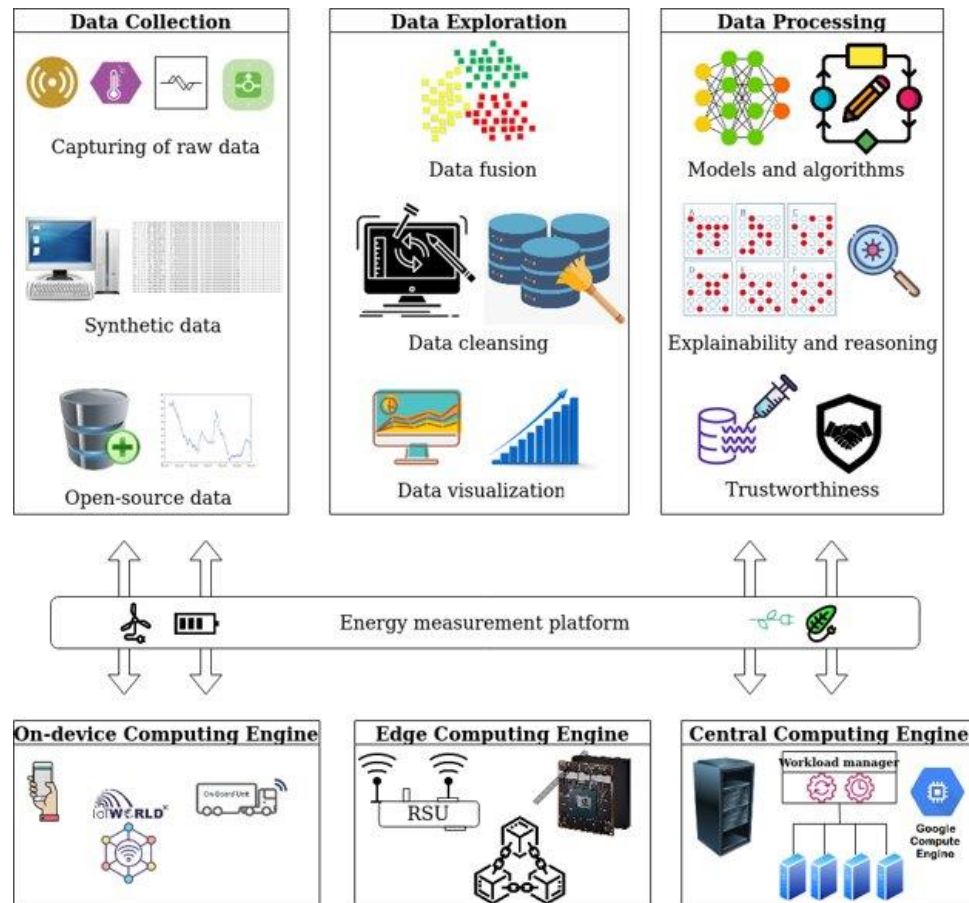

## Laboratory & Platform

- 30m<sup>2</sup> room
- Data Processing Centre
- Edge nodes
- Different types of sensors (air quality, CO<sub>2</sub>/humidity/°C)
- HD cameras
- LIDARs
- 5G connectivity (ORAN)
- Power measurement

- **Multiple datasets**

- 4G Mobile data
- Urban traffic
- Energy grid
- Connected vehicles

**SUPERCOM**  
<https://supercom.cttc.es>

# KNOWLEDGE, EXPERTISE & SKILLS

- **Edge Intelligence**

- Collaborative & Distributed AI
  - Federated Learning, Continual Learning, Transfer Learning
- Efficiency vs accuracy (Green AI)
- Explainable AI
- Application to smart cities, mobile network

- **Industrial IoT**

- Data reconstruction
- Explainable AI
- Adversarial ML
- Digital twin
- Applications: Energy system

- **Intelligent transportation systems**

- Misbehavior detection in vehicular systems
- Hazard detection (sensors + ML)

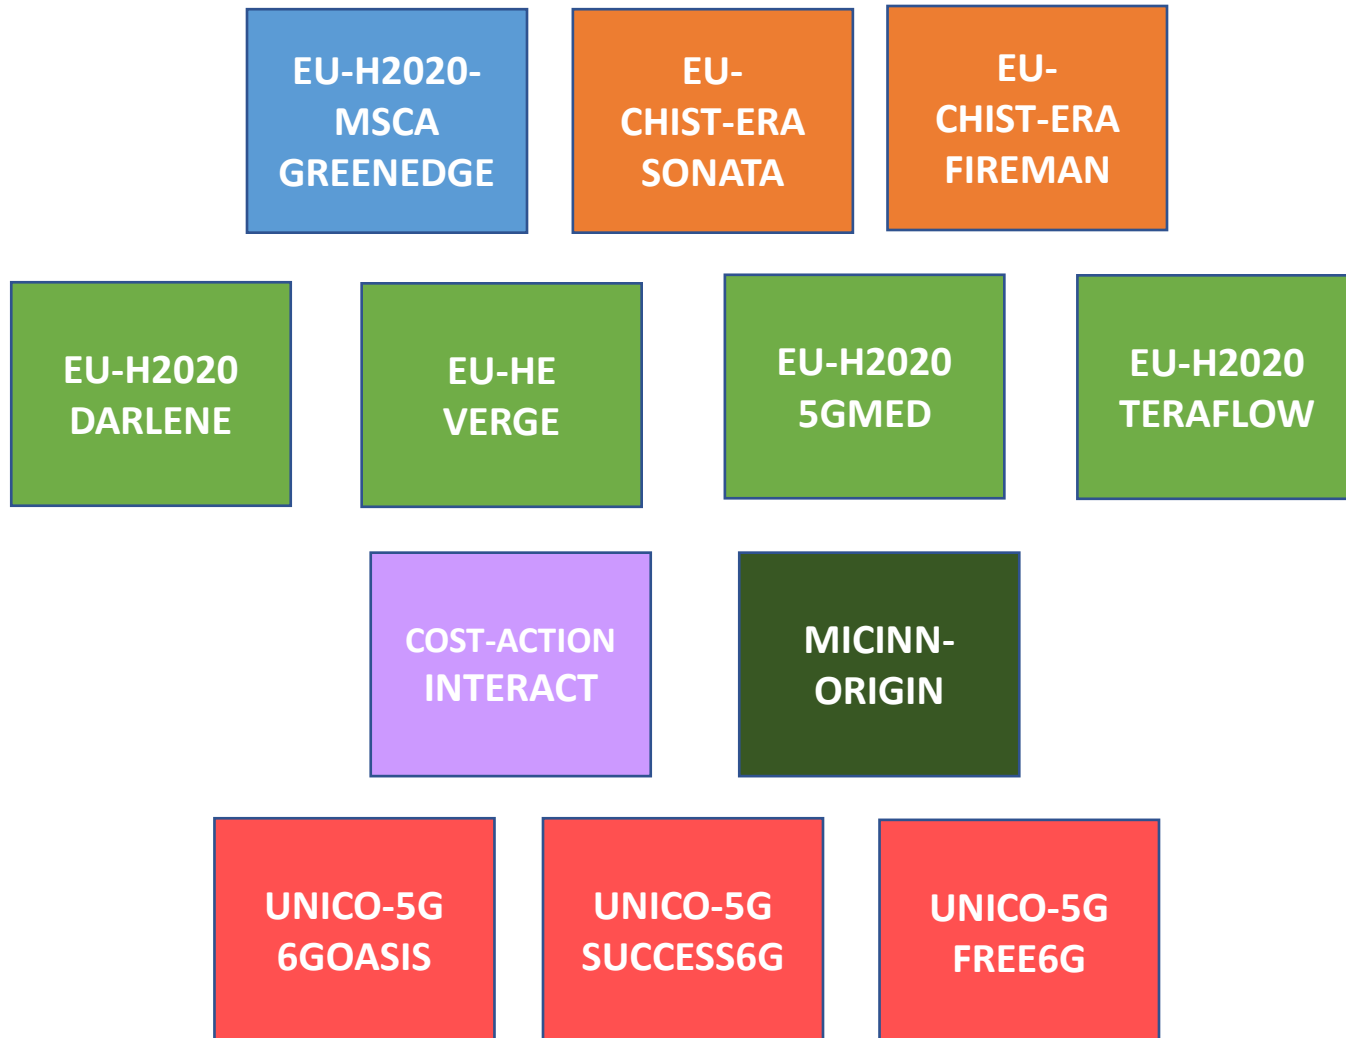

- **Mobile traffic characterization**

- Distributed ML at BS site
- Traffic prediction, classification & anomaly detection
- Data from operational networks (our own)
- Usage of mobile data for smart cities

- **Renewable energy integration & management**

# ONGOING PROJECTS

# SYNERGIES WITH THE PROGRAM

---

- **STREAM-B-01-01: System Architecture**
  - AI powered edge cloud continuum
  - Energy efficiency enablers
  - Digital network twinning applied in 6G
  - New communication paradigms with enhanced intelligence (semantic)
- **STREAM-B-01-02: Wireless Communication Technologies and Signal Processing**
  - Novel techniques for integrated sensing and communication (AIoT)
  - Optimal usage of wireless edge caching
- **STREAM-B-01-03: Communication Infrastructure Technologies and Devices**
  - Development of low-energy communication solutions
- **STREAM-B-01-04: Reliable Services and Smart Security**
  - Cooperative holistic E2E security for 6G architectures
  - Zero-touch integrated security deployment
  - Exploitation of (distributed) AI/ML for 6G Infrastructures
- **STREAM-B-01-07: Sustainability Lighthouse**
  - Improving energy efficiency and total energy consumption
  - Investigating network- device performance versus energy consumption trade-offs
  - Developing strategies to ensure that AI/ML to be environmentally sustainable
  - Address energy resilience considering the intermittent availability of renewable energy
- **STREAM-B-01-08: Reliable AI for 6G Communications Systems**
  - Realistic applicability of AI common data sets and/or federated learning methodologies and assessment models, including re-training of models with the introduction/update of the data sets
  - Metrics and models to assess the pros and cons of AI technologies in telecommunications, including aspects as energy efficiency, explainability, reliability, safety and security

# Thanks for your kind attention!

**Raúl Parada**

raul.parada@cttc.es

# ANNEX

# COLLABORATIVE & DISTRIBUTED ML

- **Scenario: edge devices w. constrained capabilities and renewable energy**
- **Distributed Training**
  - Learning across the edge devices exploiting the distributed nature
  - ML Solutions: Federated plus Continual, Transfer, Meta
  - Enablers: Orchestration with data Entropy, Value of Information, energy, accuracy

- **Distributed Inference**
  - Goal: increase the efficiency of the models
  - Model adaptation: Gradient compression/quantization, NN splitting
  - Attention mechanisms
  - eXplainable AI

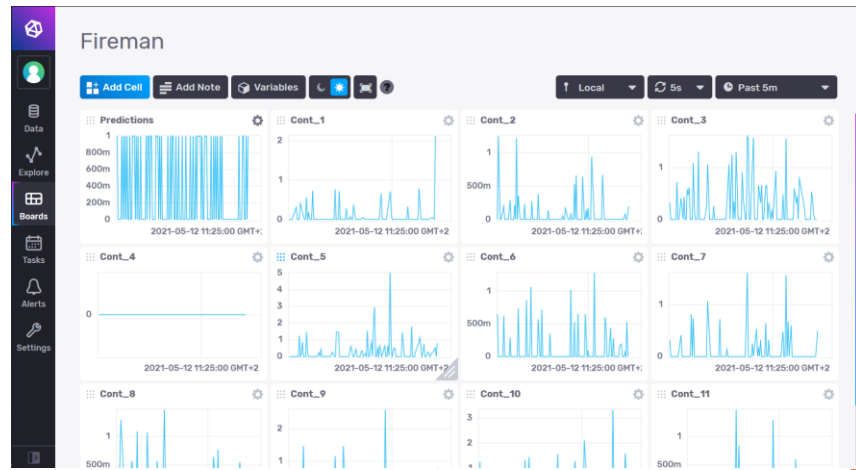

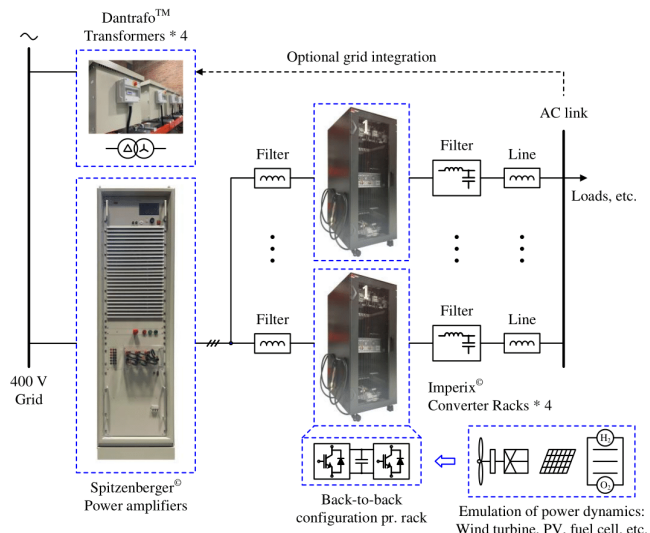

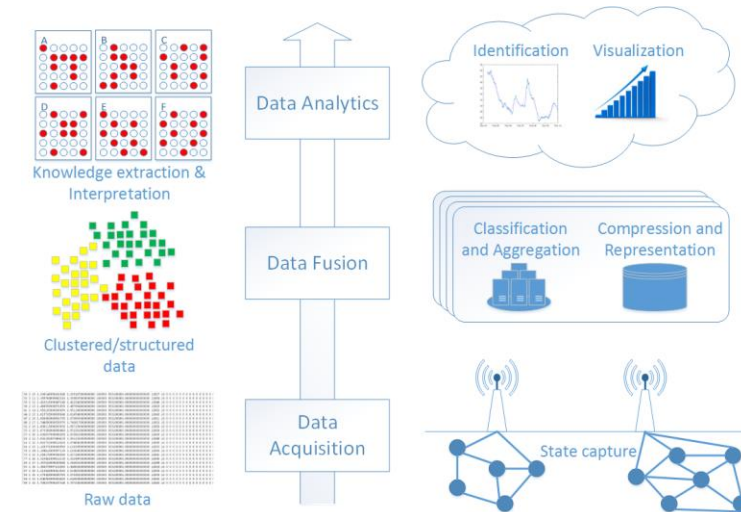

# MISBEHAVIOR DETECTION IN VEHICULAR SYSTEMS

- **AI-based solutions** for the detection of highly sophisticated attacks:
  - Deep reinforcement learning
  - Ensemble learning
- Lightweight and **online** attack classification for streaming vehicular data (open-source)
- **Mobility model-agnostic** approaches in the absence of prior knowledge associated with physical traffic phenomena:
  - Spike-based novelty detection
  - Quickest change detection

# DATA-DRIVEN OPERATIONAL PRINCIPLES OF NETWORKED INDUSTRIAL SYSTEMS

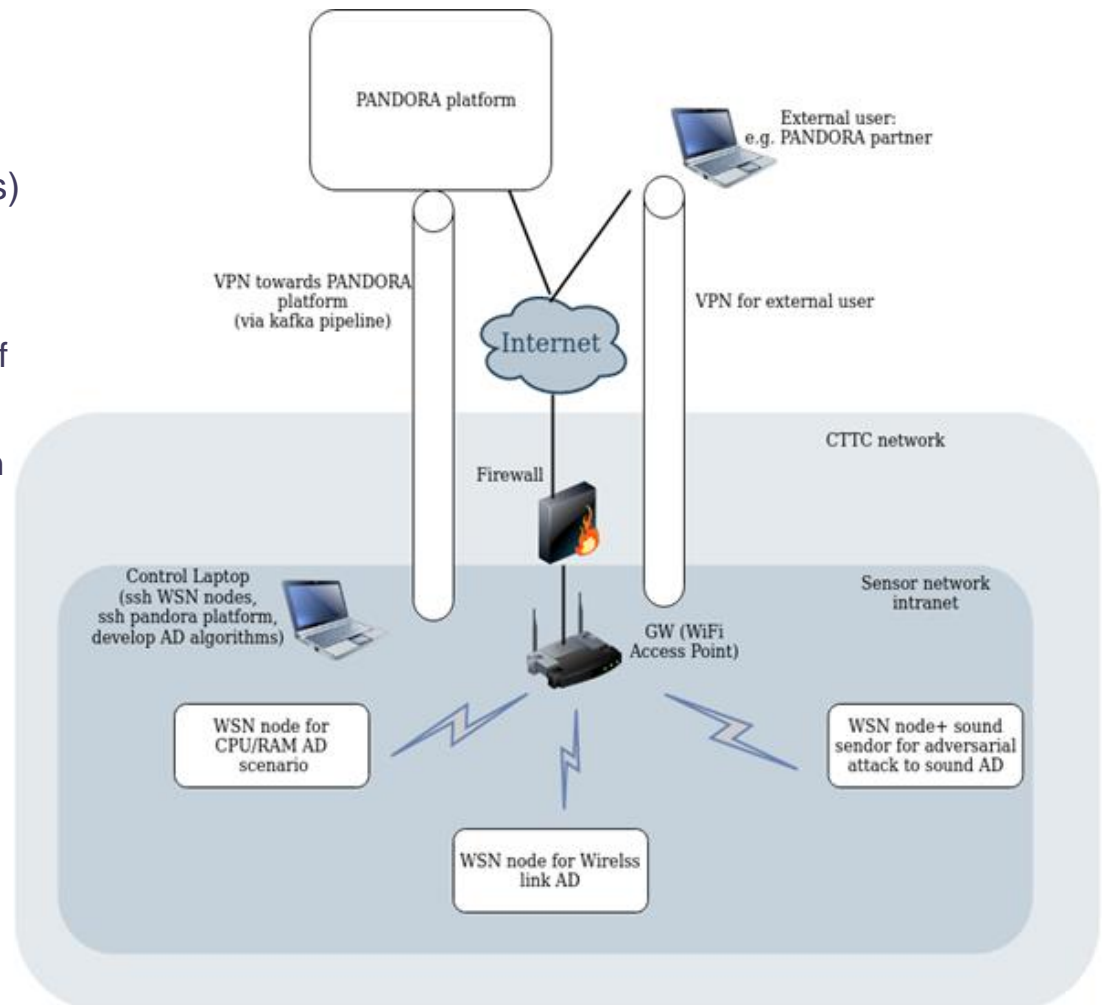

- **Physics-informed** sensor sampling strategies
- Data **reconstruction** of missing sensor observations
- **Explainable AI (XAI)** approaches for regression/classification tasks
- **Beyond-5G** connectivity enablers
- **Digital twin** for fault diagnosis
- **Open-source** end-to-end monitoring solution

# ADVERSARIAL ML FOR IOT

## Cybersecurity in IoT:

- A WSN is monitoring and protecting a critical infrastructure (e.g. sound sensors)
- Potential Cyber attacks
  - Attack to the WSN node's resources
  - Jamming attack to the wireless link of a WSN node
  - Adversarial attacks to the information gathered by the WSN
- **ML-based Detection and mitigation of cyber attacks**
  - Time-series anomaly detectors for different data modalities (cpu, ram, RSS, loudness data). E.g. autoencoders
  - Robust ML to adversarial attacks

# MOBILE TRAFFIC MODELING

- Physical control channel fingerprinting
- Distributed learning at BS site

(a) Castelldefels: suburban area with a university campus.

(b) Camp Nou: mainly residential area with Barcelona FC stadium.

- **Traffic prediction** based on RNN and CNN models and with transfer learning
- **Traffic classification**: app identification based on active measurements
- **Joint traffic prediction and classification** using multi-task learning
- **Traffic anomaly detection** for identifying of urban anomalies
- Usage of **transfer and federated learning** to build a general model from multiple cells

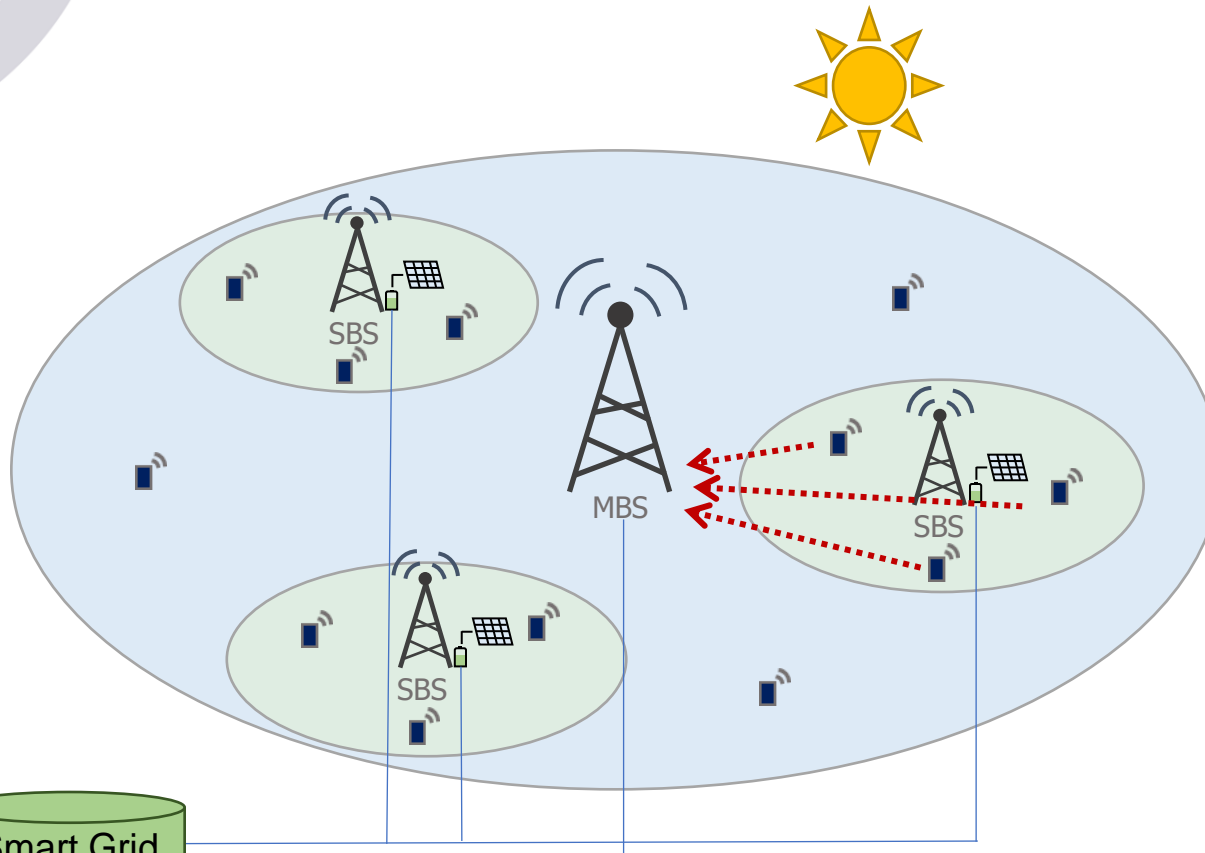

# ML BASED AWARENESS FOR INTELLIGENT TRANSPORTATION SYSTEMS

- Solutions for **intelligent transportation systems (ITS)** require understanding (i.e. awareness) of complex dynamics for providing effective solutions.
- **ML algorithms coupled with sensor** networks could provide accurate modeling of traffic and urban environments to enhance road-safety, security, intelligent mobility, etc.

- Example:
  - **V2X-Eyeguard** is a ML solution for real-time video segmentation and object tracking applied to evaluation of hazards in roads
  - V2X integration makes the base for **cooperative awareness** by providing inputs to a distributed model of road traffic. This model could be used to provide traffic **recommendations and warnings, increasing safety and traffic efficiency**
  - Awareness provided by model would be the base to **more complex applications** (e.g. autonomous driving).

# ENERGY HARVESTING MOBILE NETWORKS

- BS (macro and small) are powered with smart grid and local energy harvesters
- Small BSs perform traffic and energy offloading
- Throughput-energy trade off
- Design of agents enabling different BS operation modes
- The energy harvested at the SBS sites can be transferred to other BSs or used to provide ancillary services

Advanced research for everyday life
